.Q: What does the "symbol" of a manifold actually mean? When I say "symbol" in the context of Riemannian geometry, I can intuitively understand what it means: for instance, the Ricci scalar of g is a function of the Ricci scalar R of the Christoffel symbols Γ of g . Now when I see something like the "symbol" (also called the "scalar curvature") of the Schouten tensor S I do not understand it at all. Does S have a "Riemannian" meaning? How does one view it from the point of view of Riemannian geometry? A: The word "symbol" is used very loosely. The one example that comes to mind is sectional curvature. You consider a plane $p \subset M$. Its curvature is $K(p) := \rho(p, p)$ where ρ is the Riemannian curvature tensor. You can express the Riemannian curvature tensor via the Christoffel symbols: $\Gamma_{ij}^k = \frac{1}{2} (\delta^k_i \delta^j_j + \delta^k_j \delta^i_i - \delta^k_i \delta^j_j)$, which gives $\rho(p, p) = \frac{1}{2} (\sum_i \delta^i_i \delta^i_i - \sum_i \delta^i_i \delta^i_i)^2$. This is (up to scaling) the average $\rho(p, p) = \frac{1}{n} \sum_i (\delta^i_i \delta^i_i - \sum_i \delta^i_i \delta^i_i)$

Nov 2, 2017 A paper about the 2D noise spline-based terrain creation 3ds Max plugin SplineLand in development videos SplineLand. Nov 12, 2018 SplineLand 1.ds Max 2014 to 2020 : SplineLand is a plugin for Autodesk 3ds Max that helps to generate topographically accurate terrains. Hematologic Disorders of the Neonate: A New Era in Diagnostic Radiology. Although it is known that the hematologic disorders that are seen in the neonatal period are the same as those seen in older children and adults, the location of these disorders within the hematopoietic cascade is such that it is difficult to detect the most important and most clinically apparent abnormalities. A primary advantage of current pediatric imaging is the ability to image whole-body systems.

This allows the radiation-exposed imaging sites to be examined, along with the internal organs that are most likely to show abnormalities. In addition, magnetic resonance imaging may obviate the need for ionizing radiation or blood sampling and allow noninvasive diagnosis. Combining these advances with knowledge of normal anatomic and physiologic development can allow the most useful information to be gathered and the least radiation delivered to the smallest amount of tissue. In a first

for the world, a team of U.S. surgeons say they've performed a robotic face transplant on a comatose patient in an experimental, mid-stage trial. "The transplant, which involved the patient in a vegetative state for nearly two decades, is a milestone in the emerging field of xenotransplantation, which allows transplantation of organs from animals into humans," says Dr. J. Bradford Freeman, director of the National Institutes of Health's National Institute for Biomedical Imaging and Bioengineering, which funded the research. The 45-year-old victim of a work-related injury in 1999 has no memory of the accident and, while his parents worried in vain for years about their son, received no treatment for brain damage. But he also has no feeling in his face, which had become detached and rotated into a more 90-degree face position. In addition, the victim's body is riddled with kidney and liver disease, and his left arm and leg have no feeling. He was a paraplegic. However, Dr. Freeman's team of five investigators at the University of Pittsburgh Medical Center and the University
