Abstract A major goal in experimental psychology has been to reduce observed behavior to its underlying cognitive processes. Thus, in contrast to traditional approaches that attempt to connect behavior to external stimuli, many modern investigations focus on the cognitive origins of behavior. Two aspects of this shift from stimulus to process have been particularly influential: (1) The application of psychological theories to real-world problems and (2) the application of "cognitive psychology" to non-human animals. Thus, the present article considers the contribution made by a small set of theoretical principles to modern research in animal cognition. Specifically, it explores how the principles of rational inference and optimal decision-making can shed light on animal behavior. Full Text Cognitive psychology In psychological science there are two general approaches to the study of the mind: the "top-down" approach and the "bottom-up" approach. The former is concerned with the behaviorist model of behavior and focuses on the external causes of behavior. The latter is concerned with the cognitive processes that underlie behavior and, by definition, can only be studied from the inside. As the name suggests, bottom-up research takes its cue from cognitive psychology, which is concerned with the psychology of cognition. Early work in cognitive psychology can be traced to E. J.

Gibson, whose "ecological optics" theory of perception put a functional and evolutionary grounding on perception. The influential approach known as "cognitive science" to current psychology is bottom-up in that it draws on the principles of evolutionary biology and behavior to explain how animals learn, process information, and make decisions. In his 1958 book, *The Symbolic Species*, Theodor L. Stokowski, who was the first to apply and emphasize the role of cognitive processes in psychology, wrote: "From the moment of its inception, evolutionary psychology has been marked by two fundamental characteristics: the application of
