Is there a way to use the same page to both echo the value \$field1 and the number of rows that have the value \$field1? So like: echo the value \$field1 and at the same time show the number of rows that have the value \$field1? A: Try this. 5b5f913d15

I am running the app from IIS 7.5, and would like to be able to access this data outside of the app, such as from a Windows service. For example, I would like to be able to perform the following: `string appDataPath = Path.Combine(HttpContext.Current.Server.MapPath("~/App_Data/"), "FooBar");` My question is, if the site is running from IIS, can I set the app\_data path dynamically? The reason I ask is that the path needs to be set to a fixed value when the site is installed, but needs to be set dynamically if the site is running from a Windows service. A: You cannot. There is an app\_data folder only for an ASP.NET application. It exists in a per-application context and is hidden/inaccessible to users. A: If you're OK with the "security" risk of letting an "external" service use your app\_data folder, you could set the app\_data folder up as a virtual directory on your server (IIS), and have your service access it by using a physical path relative to your server instead of a virtual one: `string appDataPath = Path.Combine(Server.MapPath("~/App_Data/"), "FooBar");` I don't think there's a "quick" way of doing this, though. Alternatively, you could store your app\_data data on a physical server outside of your app's IIS context, and then write a custom handler in your app that takes a "path" parameter and opens up that physical server and copies data to the proper location. A: You could have the service access the site via an
