Stress distribution in the forehead of healthy non-smokers and smokers during eye closure. To analyze stress distribution patterns in the forehead of healthy non-smokers and smokers during eye closure. In vivo study. Twenty-five healthy non-smokers and 23 smokers (18 male and 5 female; mean age, 39.5 years [range, 17-65 years]; mean daily cigarette consumption, 20.8 ± 2.6 cigarettes [range, 10-35 cigarettes]). Strains of 1D, 2D, and 3D displacements of the forehead during eye closure with the right and left eye closed were evaluated with a 2-mm-high rigid sphere. Stress distribution. Peak displacements in 3 dimensions were greater in smokers than non-smokers during closing of the right and left eye. Positive correlations were found between peak displacements in 3 dimensions and the number of cigarettes smoked per day. Stress in the forehead is greater during eye closure in smokers compared to non-smokers. This is attributed to a smaller amount of soft tissue in the forehead that limits the resilience of the tissues in the face of pressure.

Q: Failed to assign MongoDB's connection string at startup I am running a test app to connect to MongoDB from .Net code, but when I try to start the app I get an error. I tried to add the connection string via the app.config, but it still has the same error. Here's the stack trace: System.InvalidOperationException was unhandled Error Code: 3675 Message: Failed to assign connection string'mongodb://localhost:27017/test' to instance of type 'MongoServer' of namespace 'Mongo'

A: There's this great regex answer to the same question: Regex for Title and release time with placeholders It covers the placement of the placeholders as well. The development of drug resistance in a population of Escherichia coli and co-development of resistance to aminoglycoside and fluoroquinolone. To compare the rates of resistance to aminoglycosides and to fluoroquinolones in a population of Escherichia coli over time. All Escherichia coli isolated from blood cultures at each of four Adelaide hospitals between 1997 and 2007 were tested for sensitivity to aminoglycosides and for the presence of genes encoding resistance to fluoroquinolones. A population of E. coli from the Royal Adelaide Hospital in 2007 was subjected to a multilocus sequence typing (MLST) analysis. Isolates from a population of E. coli isolated in 1988 at the same hospital were also subjected to MLST analysis, and a combination of MLST and pulsed field gel electrophoresis (PFGE) was used to analyse the emergence of unique strains in the community. Among 976 isolates of E. coli that were tested for sensitivity to aminoglycosides, there was a significant change in the proportion of strains resistant to streptomycin over time ($P = 0.002$). This resistance was largely due to the development of resistance to the aminoglycoside kanamycin over the time period. Among 716 isolates of E. coli tested for sensitivity to fluoroquinolones, there was a significant change in the proportion of isolates with decreased sensitivity over time ($P = 0.002$). This change was largely due to the development of resistance to ciprofloxacin over the time period. Among 28 isolates of E. coli that were subjected to both MLST and PFGE, six were shown to have emerged as unique strains, including the emergence of a clone that was found throughout the Adelaide community by 2007. Our study suggests that the development of resistance to both aminoglycosides and fluoroquinolones over time may be partially attributable to a selection pressure exerted by the misuse of these antibiotics. Exposure to heavy metals from fine particulate matter and metals in fish in the River Thames. As the fine particles (PM(2.5)) emitted from urban areas are being reduced by atmospheric vehicle emissions controls, there is concern about a concomitant increase in 3da54e8ca3
