Monitor On-Off Description: Here is a short description about this plugin. You can setup up to 80

What's New in the?

- Monitor Saver Pro is a plugin for gPhotoShow Pro, which is able to turn on / off connected computers at a specified hour of the day, or after a specified amount of time, or turn off the PC. This plugin is very useful in situations where you want to conserve energy (for example if you are having a meeting or reading in bed), or if you don't want to leave your computer on all the time. It's very simple to set up and configure, just load the product from the PlugIn menu (from the main window) or by clicking here. - The plugin requires a connection to the MCL3 server. - The MCL3 server must be installed and configured on all computers. - Registering the plugin with the server (to obtain the user's credentials) is automatic. - You can use one or more computers to set the specified hours. - By default, they will be turned on automatically at the specified hours. - You can also set and define a specific time when they will be turned on or off. - You can define a limit (in time or number of days) to which an hour is considered as in use or idle, and the plugin will automatically turn off the computer every time this limit is reached. - It can be useful to automatically shut down the computer at a certain time every day, independent of the availability of the user. Monitor On-Off Features: - Changeable options: * Day* and *Hour* (configured in *Settings* window) - Configurable schedule (configured in *Settings* window) - Set up parameters for all computers from one place (configured in *Settings* window) - All settings can be made global, so all the computers will follow the same schedule at the same hour - Supports switching off immediately (shutdown), put in standby (hibernate) and/or sleeping (suspend). - Allows to activate or de-activate connected computers. When an user turns off his computer he will be disconnected from the network and will not be able to log on again during the specific time set for this computer. - Monitor is not turned on with the connected computer when the user turns off the computer. - Monitor is turned off in a second after the computer has been shut down (so the user has no idea when it was shut down). - Additional

note: If you want your PC to be turned off/on at a specific
