A: You can process and split your strings in a non-linear way like so: REPLACE(REPLACE(A18,"PDF","PDFs"),',','') /\*OR \$str.replace(str,'"','')/ You can write a function to do this, or just loop over a table of sub-strings and concatenate them together. to file a certificate of appealability with our clerk. 28 U.S.C. § 2253(c)(1)(B). AFFIRMED -2- This invention relates to a safety device for cutlery, particularly knives and forks. More specifically, this invention pertains to an arrangement for preventing a knife from being used as a weapon. This arrangement is intended to prevent the unauthorized removal of a knife from a knife holder and the unauthorized adjustment of the knife blade. It is known in the prior art to place knives in a knife holder and to then lock that holder in a knife block. However, this prior art arrangement requires that one open and close the knife block in order to unlock and then open the knife holder. Accordingly, this prior art arrangement is very inconvenient for those persons who often carry a knife. The present invention provides an arrangement in which one may easily adjust the knife blade using a knob to open and then close the knife holder and lock the position of the holder without having to open and close the knife block. With the arrangement of the present invention, there is no need to open and close the knife holder and the locking mechanism to adjust the blade of the knife. This has a great advantage when the knife holder is in a portion of the person's hand, such as the handle of a hand, where it would be dangerous to access the locking mechanism.Q: What's the difference between Java array and String array?
