Systems include:This application, in response to PA-06-324, is to continue to respond to the need for investigators with an interest in pediatrics and medical genetics. The volume of materials and techniques available to the pediatrician in the diagnosis and management of various genetic conditions is increasing rapidly. It is unlikely that physicians will have a sufficiently trained workforce to master the large number of genetic disorders and their management. We propose a Master of Science Program in Clinical Genetics for Academic Pediatricians, designed to equip trainees with the knowledge to be capable of supervising clinical research in the area of genetic disorders. It is our intent to develop a cadre of individuals who can perform independent genetic research in the areas of clinical care, while at the same time teach medical genetics to the large number of pediatricians who will perform primary care. The program also intends to provide a framework for those interested in careers in clinical research in the field of genetics. The main focus of the program will be to provide the competencies necessary for the trainee to become an independent genetic investigator. It is the intent of the program to provide the trainee with the skills and knowledge to function in an independent fashion as a medical geneticist. We expect trainees will be able to obtain positions in medical genetics departments at a major academic medical center as well as positions at a clinical trial unit, as well as working at private practices or within academic medical centers. The program will have direct supervision of six major areas. These are: clinical, lab, research, teaching, administration, and a portion of the didactics and research skills. There are c6a93da74d
